

Community Module Documentation

Overview .1

:The Community module is implemented across

- `src/Presentation/Mentora.API/Controllers/Community/*` — community API endpoints •
- `src/Core/Mentora.Application/Services/Community/*` — community business logic •
- `src/Core/Mentora.Application/DTOs/Community/*` — request/response contracts •
- `src/Core/Mentora.Domain/Entities/*Community*.cs` — community data model •
- `src/Infrastructure/Mentora.Persistence/Repositories/Community/*` — data access •
- `ApiResponse.cs` — standard API response wrapper •

:The module covers

- Community creation, update, delete •
- Membership management •
- Community posts, comments, likes, saves, shares •
- Reporting posts/comments •

.All routes are under `api/communities` and require authentication

Business Logic & Constraints .2

- .Community names must be unique globally •
- .A community creator is automatically added as `Owner` •
- `CreateCommunity` requires `Name`, optional `Description`, optional `CoverImageUrl`, and `DomainId` •

:Ownership rules

- .Only `Owner` or `Admin` can update community details •
- .Only `Owner` can delete the community •

:Member rules

- .Users join via `/join`
- .Banned members cannot join
- .An `Owner` cannot leave their own community

:Role rules

- .Only the `Owner` can change roles
- .`Owner` role cannot be assigned or reassigned through role update
- .`Owner` cannot be demoted or removed

:Ban rules

- .Only `Owner` or `Admin` can ban members
- .`Owner` cannot be banned

:Post rules

- .Only community members can create community posts
- .Only post authors can update their post
- .Posts can be deleted by the author, or by `Owner` / `Admin` of the community

:Comment rules

- .Any authenticated user can create comments on existing posts
- .Only comment author can update comment
- .A comment can be deleted by author or by community `Owner` / `Admin`

:Like/Save/Share rules

- .Likes and saves are toggle operations
- .Share does not require membership check; it only requires the post exists

:Report rules

- .Any authenticated user can report a post and optionally a comment
- .Report target comment must exist if `TargetCommentId` is provided
- .Only `Owner` or `Admin` can update report status or delete reports
- .Report list endpoint only returns pending reports for the given post

Roles & Permissions .3

Roles

:From `CommunityRole.cs`

Role	Value
Owner	1
Admin	2
Member	3

Permissions Table

Member	Admin	Owner	Action
			Update community
			Delete community
			Change member roles
			Remove members
			Ban members
			Delete posts/comments/reports
			Create posts
			Comment
			Like/Save/Share posts
			Report content

DTOs Documentation .4

Community DTOs

CreateCommunityDto

Nullable	Required	Type	Field
No	Yes	string	Name
Yes	No	?string	Description
Yes	No	?string	CoverImageUrl

No  Yes  int DomainId

UpdateCommunityDto

Nullable	Required	Type	Field
Yes 	No 	?string	Name
Yes 	No 	?string	Description
Yes 	No 	?string	CoverImageUrl
Yes 	No 	?int	DomainId

CommunityResponseDto

Nullable	Type	Field
No 	Guid	CommunityId
No 	string	Name
Yes 	?string	Description
Yes 	?string	CoverImageUrl
No 	int	DomainId
No 	int	MembersCount
No 	int	PostsCount
No 	DateTime	CreatedAt
No 	string	CreatedByUserName
Yes 	?string	CreatedByUserProfilePicture

Post DTOs

CreatePostDto

Nullable	Required	Type	Field
No 	Yes 	string	Content
Yes 	No 	?string	ImageUrl

Yes  No  ?string LinkUrl

UpdatePostDto

Nullable	Required	Type	Field
Yes 	No 	?string	Content
Yes 	No 	?string	ImageUrl
Yes 	No 	?string	LinkUrl

PostResponseDto

Nullable	Type	Field
No 	Guid	CommunityPostId
No 	string	Content
Yes 	?string	ImageUrl
Yes 	?string	LinkUrl
No 	DateTime	CreatedAt
No 	int	LikesCount
No 	int	CommentsCount
No 	int	SharesCount
No 	Guid	AuthorId
No 	string	AuthorName
Yes 	?string	AuthorProfilePicture

Comment DTOs

CreateCommentDto

Nullable	Required	Type	Field
No 	Yes 	string	Content

UpdateCommentDto

Nullable	Required	Type	Field
No	Yes	string	Content

CommentResponseDto

Nullable	Type	Field
No	Guid	CommunityCommentId
No	string	Content
No	DateTime	CreatedAt
No	Guid	AuthorId
No	string	AuthorName
Yes	?string	AuthorProfilePicture

Membership DTOs

MemberResponseDto

Nullable	Type	Field
No	Guid	UserId
No	string	UserName
Yes	?string	ProfilePictureUrl
No	CommunityRole	Role
No	DateTime	JoinedAt

Report DTOs

CreateReportDto

Nullable	Required	Type	Field
No	Yes	CommunityReportReason	ReportReason
Yes	No	?string	AdditionalComment

Yes No 

?Guid

TargetCommentId

ReportResponseDto

Nullable	Type	Field
No 	Guid	CommunityReportId
No 	CommunityReportReason	ReportReason
Yes 	?string	AdditionalComment
No 	CommunityReportStatus	Status
No 	DateTime	CreatedAt
No 	Guid	ReporterUserId
No 	string	ReporterName
Yes 	?Guid	TargetPostId
Yes 	?Guid	TargetCommentId
No 	int	ReportsCount

    <

```

Status Codes: 200 OK, 400 Bad Request •

GET /api/communities/posts/saved

Description: Get all posts saved by the current user •

Auth: Required •

Response: ApiResponse<IEnumerable<PostResponseDto> •
<<

Status Codes: 200 OK •

Share Endpoints

POST /api/communities/posts/{postId}/share

(Description: Generate a shareable URL for a post (no membership check required) •

Auth: Required •

(Params: postId (Guid) •

Response: ApiResponse<string> (returns generated share URL) •

```
} •
, "success": true" •
, "message": "Post shared successfully" •
data": " •
, "https://mentora.com/community/posts/8b772237-ae10-4efa-bc88-e487c31aeb71" •
errors": null" •
{ •
( •
```

Status Codes: 200 OK, 400 Bad Request •

Report Endpoints

POST /api/communities/{communityId}/posts/{postId}/report

Description: Report a post, optionally targeting a specific comment •

```
• if report about comment •
• body •
• { •
•   "reportReason": 1, •
•   "additionalComment": "string", •
•   "targetCommentId": "00b62602-1349-46de-81d1-08deb06fcea4" •
• } •
•
```

Auth: Required •

(Params: communityId (Guid), postId (Guid) •

Body: CreateReportDto •

```
• { •
•   "reportReason": 1, •
•   "additionalComment": "string" •
```

-
- } but same response for post/comment

Response: ApiResponse<bool

```

    }
    , "success": true"
    , "message": "Report submitted successfully"
    , "data": true"
    errors": null"
    {

(Description: Delete a report (Owner or Admin only)

Auth: Required

(Params: reportId (Guid

Response: ApiResponse<bool

```

        }
        , "success": true"
        , "message": "Report deleted successfully"
        , "data": true"

```

```

errors": null"
{
<

```

Status Codes: 200 OK, 400 Bad Request

Get/api/Explore/communities

view all communities exist in platform

- Params:QuerySearch

- Response: {

```

    "success": true,
    "message": "Success",
    "data": [
        {
            "communityId": "9e11fc3a-21f1-4bb7-9f08-cfd5bbdb8755",
            "name": "back com",
            "description": "A community for developers",
            "coverImageUrl": "https://img.com/cover.png",
            "creatorName": "Rehab Baajar",
            "domainId": 1,
            "membersCount": 1,
            "postsCount": 2
        },
        {
            "communityId": "ca68a38e-e231-4119-b311-e695b69d508b",
            "name": "Tech Hub",
            "description": "A community for developers",
            "coverImageUrl": "https://img.com/cover.png",
            "creatorName": "Rehab Baajar",
            "domainId": 1,
            "membersCount": 1,
            "postsCount": 0
        }
    ],
    "errors": null

```

- }
- 200 OK,
-

Uploads .6

- .Community cover image is stored as a plain string URL in `CoverImageUrl`
- .There is **no** community-specific upload endpoint inside the Community module
- The codebase includes general file upload endpoints under `api/File`, but those are
- .separate from the Community controller
- **Frontend note:** Upload the image first via `api/File`, get back the URL, then pass it
- .as `CoverImageUrl` in `CreateCommunityDto` or `UpdateCommunityDto`

Error Responses .7

:All community endpoints return a consistent `ApiResponse<T>` wrapper on failure

```

    },
    "success": false"
    ,"message": "Error message here"
    ,"data": null"
    ["errors": ["optional validation details"
    {

```

Common Error Messages

Message	Scenario
Community name already exists	Duplicate community name
Community not found	Community not found
Only Owner or Admin can update the community	Non-owner/admin updates community
Only the Owner can delete the community	Non-owner deletes community
Only members can create posts	Non-member creates post
Post not found	Post not found

Only the post author can update	Non-author updates post
You do not have permission to delete this post	No permission to delete post
Comment not found	Comment not found
Only the comment author can update	Non-author updates comment
You do not have permission to delete this comment	No permission to delete comment
You are banned from this community	Banned user tries to join
You are already a member of this community	Already a member
You are not a member of this community	Not a member
Owner cannot leave the community	Owner tries to leave
Only Owner or Admin can remove members	Non-owner/admin removes member
Target user is not a member	Target not a member
Owner cannot be removed	Removing Owner
Only Owner can change roles	Non-owner changes role
Cannot assign Owner role	Assigning Owner role
Cannot change Owner's role	Changing Owner's role
Only Owner or Admin can ban members	Non-owner/admin bans member
Owner cannot be banned	Banning Owner
Only Owner or Admin can update report status	Non-owner/admin updates report
You do not have permission to delete this report	No permission to delete report
Authentication failures (missing/invalid token) return standard ASP.NET Core .401 Unauthorized before reaching the community controllers	

Frontend Notes .8

All community endpoints require a valid JWT bearer token in the header:

< Authorization: Bearer <token

-
- .Use `GET /api/communities/all` for browsing all communities
- .Use `GET /api/communities/my` to show the user's joined communities
- Community responses include **counts only** (`MembersCount`, `PostsCount`) — not arrays. Fetch members/posts via separate endpoints
- .Like and Save are **toggle** endpoints — call the same endpoint to like and unlike
- .`SharePost` returns a plain URL string, not a DTO object
- .`CreateComment` returns only the new comment's `Guid`, not the full comment object
- `CreateReportDto.TargetCommentId` is optional — only include it when reporting a specific comment inside a post
- :For role assignment, send the raw enum integer in the request body
 - Admin → 2
 - Member → 3
 - (Do NOT send 1 / Owner — it will be rejected)
- `CoverImageUrl` and `AuthorProfilePicture` can be `null` — always handle missing images gracefully in the UI
- .Report list only returns **pending** reports — resolved/closed reports will not appear
- .No pagination exists — frontend should be prepared to handle potentially large lists

UI Conditional Logic

UI Behavior	Condition
Show: Edit community, Delete community, Change roles	<code>currentUser.role === 1</code> (Owner)
Show: Remove member, Ban member, Delete any post/comment, Manage reports	<code>currentUser.role <= 2</code> (Owner (or Admin)
Show: Edit post button	<code>currentUser.id === post.authorId</code>
Show: Delete post button	<code>currentUser.id === post.authorId OR role <= 2</code>
Show: Edit comment button	<code>currentUser.id === comment.authorId</code>
Show: Delete comment button	<code>currentUser.id === comment.authorId OR role <= 2</code>

Hide: Create post button

User is not a member

Testing Scenarios .9

Happy Paths

Expected Result	Scenario
Returns <code>CommunityResponseDto</code> with correct data	Create community
Returns <code>true</code> , user is now a Member	Join community
Returns <code>true</code> , details updated	Owner updates community
Returns <code>PostResponseDto</code>	Member creates a post
Returns updated <code>PostResponseDto</code>	Author updates their own post
Returns <code>true</code>	Author deletes their own post
Returns <code>true</code>	Admin deletes another user's post
Returns new comment <code>Guid</code>	Create comment on a post
Returns updated <code>CommentResponseDto</code>	Author updates comment
Returns <code>true</code>	Author deletes comment
(Returns <code>true</code> (liked	Like a post
(Returns <code>true</code> (unliked — toggle	Like same post again
(Returns <code>true</code> (saved	Save a post
(Returns <code>true</code> (unsaved — toggle	Save same post again
Returns shareable URL string	Share a post
Returns <code>true</code>	Report a post
Returns <code>true</code>	Owner/Admin update report status

Failure Paths

Expected Error	Scenario
----------------	----------

Community name already exists	Create community with duplicate name
Only members can create posts	Non-member tries to create a post
Only the post author can update	User updates another user's post
Only Owner or Admin can update the community	Member tries to update community
Owner cannot leave the community	Owner tries to leave community
Owner cannot be banned	Attempt to ban the Owner
Owner cannot be removed	Attempt to remove the Owner
Cannot assign Owner role	Assign Owner role via role update
Bad Request 400	Report a non-existent comment
You do not have permission to delete this report	Member tries to delete a report
Unauthorized 401	Request with no/invalid token

Authentication .10

- .Authentication is **JWT-based**, configured in `Program.cs`
- .All community controllers use the `[Authorize]` attribute
- The user ID is extracted from JWT claims using `User.GetUserId()` (defined in `ClaimsPrincipalExtensions.cs`)
- .The token must contain `ClaimTypes.NameIdentifier` with the user's GUID
- **.No community endpoint supports anonymous access**

:How to send the token

```
GET /api/communities/all
...Authorization: Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9
```

Response Consistency .11

:<All community endpoints wrap their response in `ApiResponse<T`

Success Response

```
    }  
    ,success": true"  
  ,"message": "Optional descriptive message"  
    ,{ ... } : "data"  
    errors": null"  
  {
```

Failure Response

```
    }  
    ,success": false"  
  ,"message": "Error reason here"  
    ,data": null"  
  ["errors": ["optional validation details"  
  {
```

Frontend Handling Pattern

```
;(const response = await api.post('/communities', body  
  
    } (if (response.data.success  
      use response.data.data //  
    } else {  
    show response.data.message //  
    {
```

- Controllers return **200 OK** when `result.Success == true`
- Controllers return **400 Bad Request** when `result.Success == false`
- .Always check **success** first, then read **data** or **message** accordingly
